

AgentMart — AI Agent Marketplace for Business Automation

A frontend-only B2B marketplace that connects **AI Developers** (who publish ready-made AI agents) with **Business Clients** (who post automation requirements). Built as an S.Y.B.Sc. (Computer Science) field project at MES' Abasaheb Garware College (Autonomous), Pune.

 **Live demo:** <https://harshal-shr.github.io/Al-Agent-Marketplace-for-Business-Automation/>

Features

- **Dual-role accounts** — register as an AI Developer (GitHub link) or a Business Client (company name)
- **Form validation** — required fields, email format, minimum 6-character password, duplicate-email check

- **Systems Feed** – browse published AI systems with live search and stack-tag filters
- **Business Needs board** – clients post requirements; developers can take open ones
- **Creator Portal** – developer-only form to publish a system (clients see "Access Restricted")
- **Direct messaging** – inbox with per-conversation chat threads
- **Editable profile** – name, handle, avatar URL (live preview), bio, GitHub/LinkedIn
- **Dark / Light theme** – remembered across sessions
- **Responsive layout** – Bootstrap grid for mobile, tablet and desktop
- **No backend** – all data lives in the browser's `localStorage`

Tech Stack

Area	Technology
Structure	HTML5
Styling	CSS3 (CSS variables for theming), Bootstrap 5.3.3
Logic	JavaScript (ES6), jQuery 3.7.1

Area	Technology
Storage	Browser <code>localStorage</code>
Fonts	Space Grotesk, Inter, JetBrains Mono (Google Fonts)
Hosting	GitHub Pages

Project Structure

```
agentmart/  
├─ index.html      # Landing page (public)  
├─ auth.html       # Sign in / Register  
├─ feed.html       # Systems Feed  
├─ needs.html      # Business Needs  
├─ portal.html     # Creator Portal  
(developers only)  
├─ inbox.html      # Messaging  
├─ profile.html    # Profile editor  
├─ style.css       # Theme, layout and  
animations  
└─ script.js       # App logic +  
localStorage data layer
```

Getting Started

No installation or build step is needed.

1. Download or clone the repository

2. Open `index.html` in any modern browser
3. Click **Get Started** and register

Or serve it locally:

```
python -m http.server 8000  
# then open http://localhost:8000
```

How to Use

1. **Register** as an *AI Developer* or a *Business Client*.
2. **Developers**: publish a system in the **Creator Portal**, or browse **Business Needs** and click **Take This**.
3. **Clients**: post a requirement via **+ Post Requirement**, or browse the **Systems Feed** and click **Book Now**.
4. Use **Message** on any listing to open a conversation in the **Inbox**.

Data Storage

Everything is saved in `localStorage` under these keys:

Key	Contents
<code>agentmart_db_v1</code>	Users, systems, requirements, conversations
<code>agentmart_theme</code>	<code>dark</code> or <code>light</code>
<code>agentmart_active_conv</code>	Last opened conversation

The database is seeded with two sample systems and two sample requirements on first load. To reset the app, clear the site's data in your browser (DevTools → Application → Local Storage).

Note: This is a learning project. Passwords are stored in plain text in `localStorage` and data never leaves your browser, so do not use real credentials.
